SMART APPLIANCES

SMART TV

While regular TVs have been around for decades, these so-called "dumb TVs" only do one thing: Receive signal from an HDTV antenna, cable or another A/V source. That was great when those were you only TV viewing options, but today's connected world expects something a little smarter.

SMART WASHING MACHINE

While many of the latest washers you'll find at your local Sears or Best Buy will have full-color touchscreens that you can use to acutely customize your laundry cycle, only a select few also contain the option to hook themselves up to your home's WiFi network for additional capability. By linking either with the Nest thermostat or their own proprietary iOS and Android apps, smart washers can do everything from alerting you when a load is finished and needs to be transferred over, to using "smart tumble" features which will keep your clothes wrinkle-and-mildew free until you get back home.

SMART MICROWAVE

Driven by powerful hot air coming from the top cooking up to 30% faster than standard convection. Enjoy crispy food in minutes as the grill crisps your food on the outside without drying inside. Conserves power by turning off the display when not in use without having to unplug the microwave. Automatically adjusts cooking time for optimal results.

SMART FRIDGES & FREEZERS

They have intelligent in-built systems to keep food fresh, using vitamin-preserving lights that make sure your 5-aday are as nutritious as they can be, improved air flow systems to maintain freshness and bacteria-zapping technology that means fruit and veg can last up to 30 days. They have doors that open automatically as you approach and intelligent drawers that do the same and they stay frost-free – so there will be no more wrestling with an iced up freezer-drawer

SOUND BAR

A soundbar is the easiest way of improving the sound on your TV. They take up very little space and are really easy to set up. Sound-wise, they're much better than TV speakers. Get one with a subwoofer for a cinematic surround sound effect.

A basic definition of smart technology is that it goes beyond just the normal sending and receiving, consumer searching for information and the traditional turning things on and off. Instead, it offers the consumer much more interaction and control, through use of the Internet. Much of this definition refers to smart devices—phones, TVs, appliances, cars, personal assistants, etc. Consumers are certainly warming to the idea of using smart tech to control everything from their home security systems to their thermostats. With the fast pace of today's rapidly evolving tech world, when "smart" is used in consumer marketing, it implies both the device and network connectivity. you can get all these appliances from best buy, smart homage, appliance direct etc.
